Site is located in hilly area, with some vegetation, a definite "California" feel; is open + consists of various buildings + structures. Seems to be relatively new build. White + green are important colors to the site, as is yellow. Structures are both tall + low, smooth, light colored; some composed of cement + stone work; rectangular. Hot, rushing, roaring, venting, bubbling water is present. Mineral smells, pipes + pipe-related apparatus, like valves are present. Hot springs + geysers are strongly suggested. Area "looks like a football field"; its discolored, podemarked, undulating + bare.

CPYRGHT

## GEOTHERMAL ENERGY

# The Power of Letting Off Steam

CPYRGHT  
By KENNETH F. WEAVER  
ASSISTANT EDITOR

**T**HE SMELL OF BRIMSTONE hung on the air. Steam vents hissed at me like snakes. Craters of boiling mud seethed and burped; black bubbles formed, swelled, and collapsed with rude plops.

Heat had created a scabrous landscape almost devoid of vegetation and stained with yellow streaks of sulfur and the white crusts of mineral salts. It suggested an outpost of Dante's Inferno—although it bore the more earthly name Laguna Volcano.

Only a short distance away, towering plumes of steam sent a muffled roar to my ears. These plumes marked the location of the new Cerro Prieto power plant in northern Mexico. The heat that drove the electric generators of Cerro Prieto was the same heat that had created the wasteland at my feet. It was the terrible heat from inside the earth.

The cold, hard crust of our planet gives

**Plumes of hope** in the search for energy, steam tapped from underground reservoirs roars through pressure-release vents at The Geysers steam field, where the Pacific Gas and Electric Company operates a generating plant. Steam-driven turbines produce enough power for a city of half a million. The California facility is the only one in the U.S. now turning earth heat into electricity.

NATIONAL GEOGRAPHIC PHOTOGRAPHER EMORY KRISTOF
